

IoT in Action

#IoTinActionMS

Tackling urban development challenges with IOT

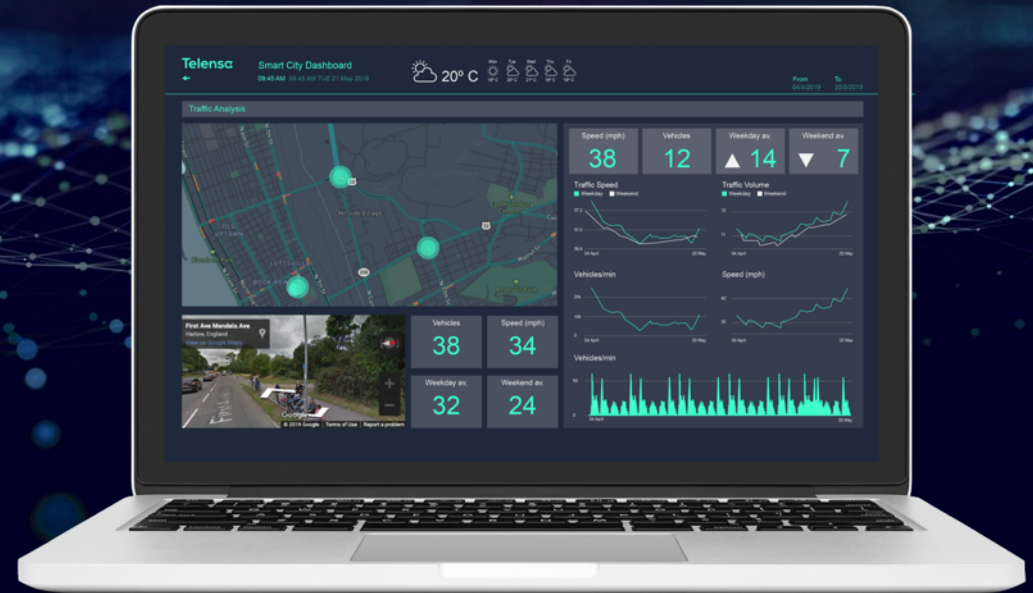

Keith Day, Telensa
Bill Wilson, Kainos

IoT in Action

Telensa

- World #1 in smart street lighting controls
- 1.7 million lights connected in 10 countries
- 400+ cities connected
- 1 in 10 of UK streetlights
- Streetlight sensor deployments
- HQ Cambridge, UK manufacturer

Cities need better data to become smart

- Cost of mass-scale data collection
- Data management and protection
- Citizen trust and transparency

Project objectives

- Cut the cost of data collection
- Make data insights easy to manage
- Protect urban data and make policies transparent

Key partners

- Microsoft: foundation technologies
- Kainos: AI, data and govtech expertise

Urban Data Project

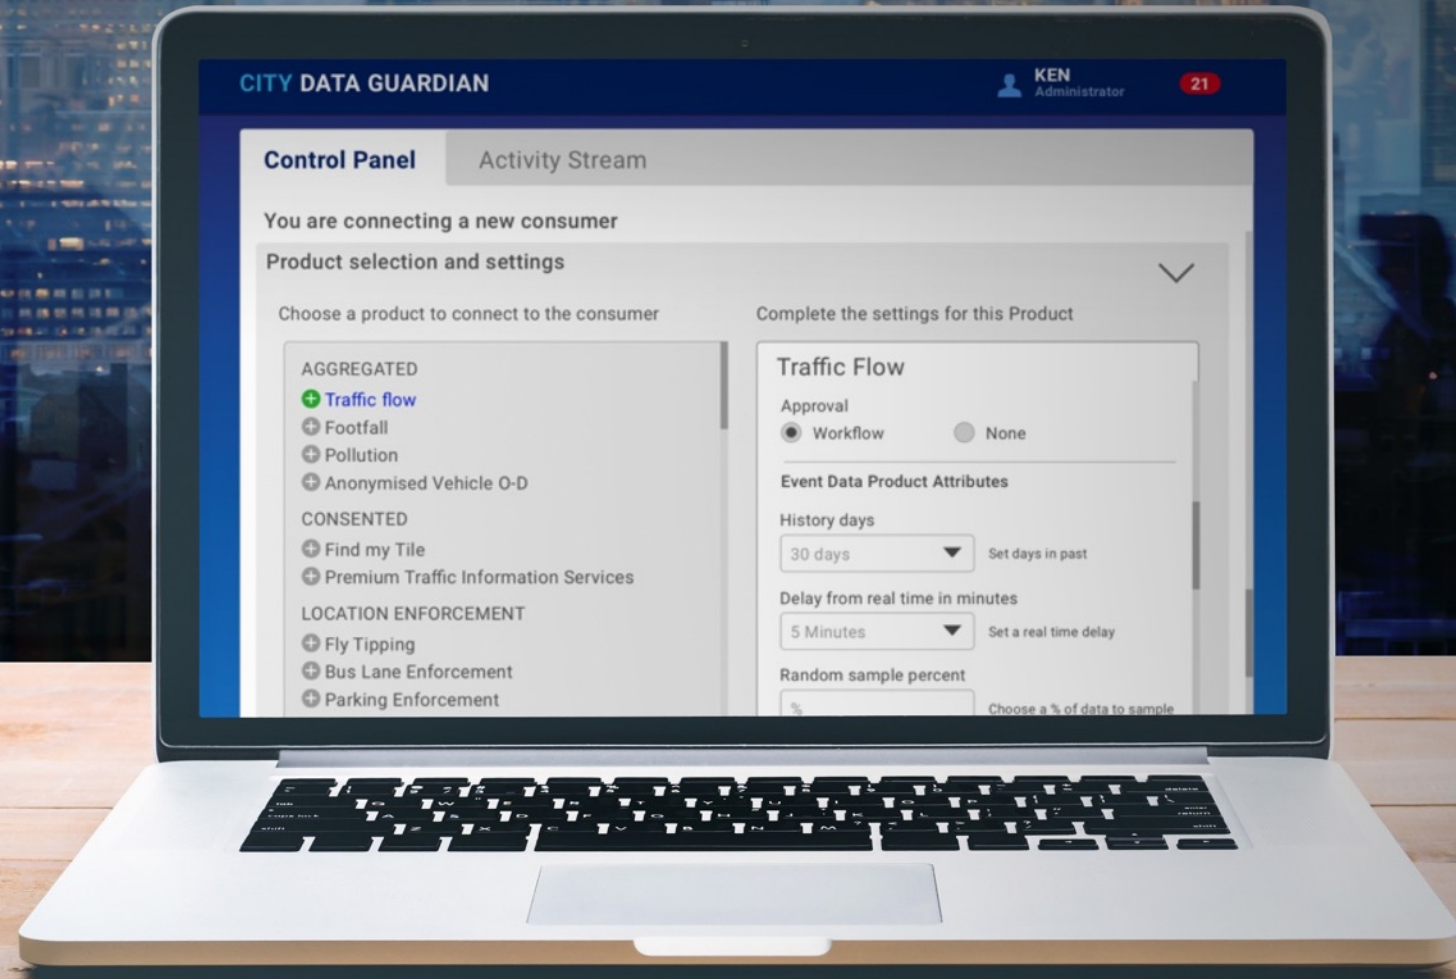

AI and edge processing

- Low-cost camera/radar imaging with Qualcomm smartphone AI
- Detailed, real-time data covering all traffic types including pedestrians
- All data is anonymised on the device using machine learning
- Edge processing reduces comms costs to a minimum
- Runs on Microsoft Azure IoT Edge

City Data Guardian

- Protects ownership and control of data assets
- Combines data from many sources
- Enables the controlled monetization of data assets
- Publishes data policy for citizen transparency
- Built with Kainos on Microsoft Azure

First deployment in Cambridge May 2019

Pilot installation

Classification, routing, events

Regulatory compliance

What kinds of data are we talking about?

- Classification of vehicle types:
 - pedestrians, bikes, cars, trucks
- Origin-destination information:
 - through vs. local traffic
 - taxi/uber patterns
 - last mile delivery patterns
- Service usage patterns
- Air quality – traffic overlays

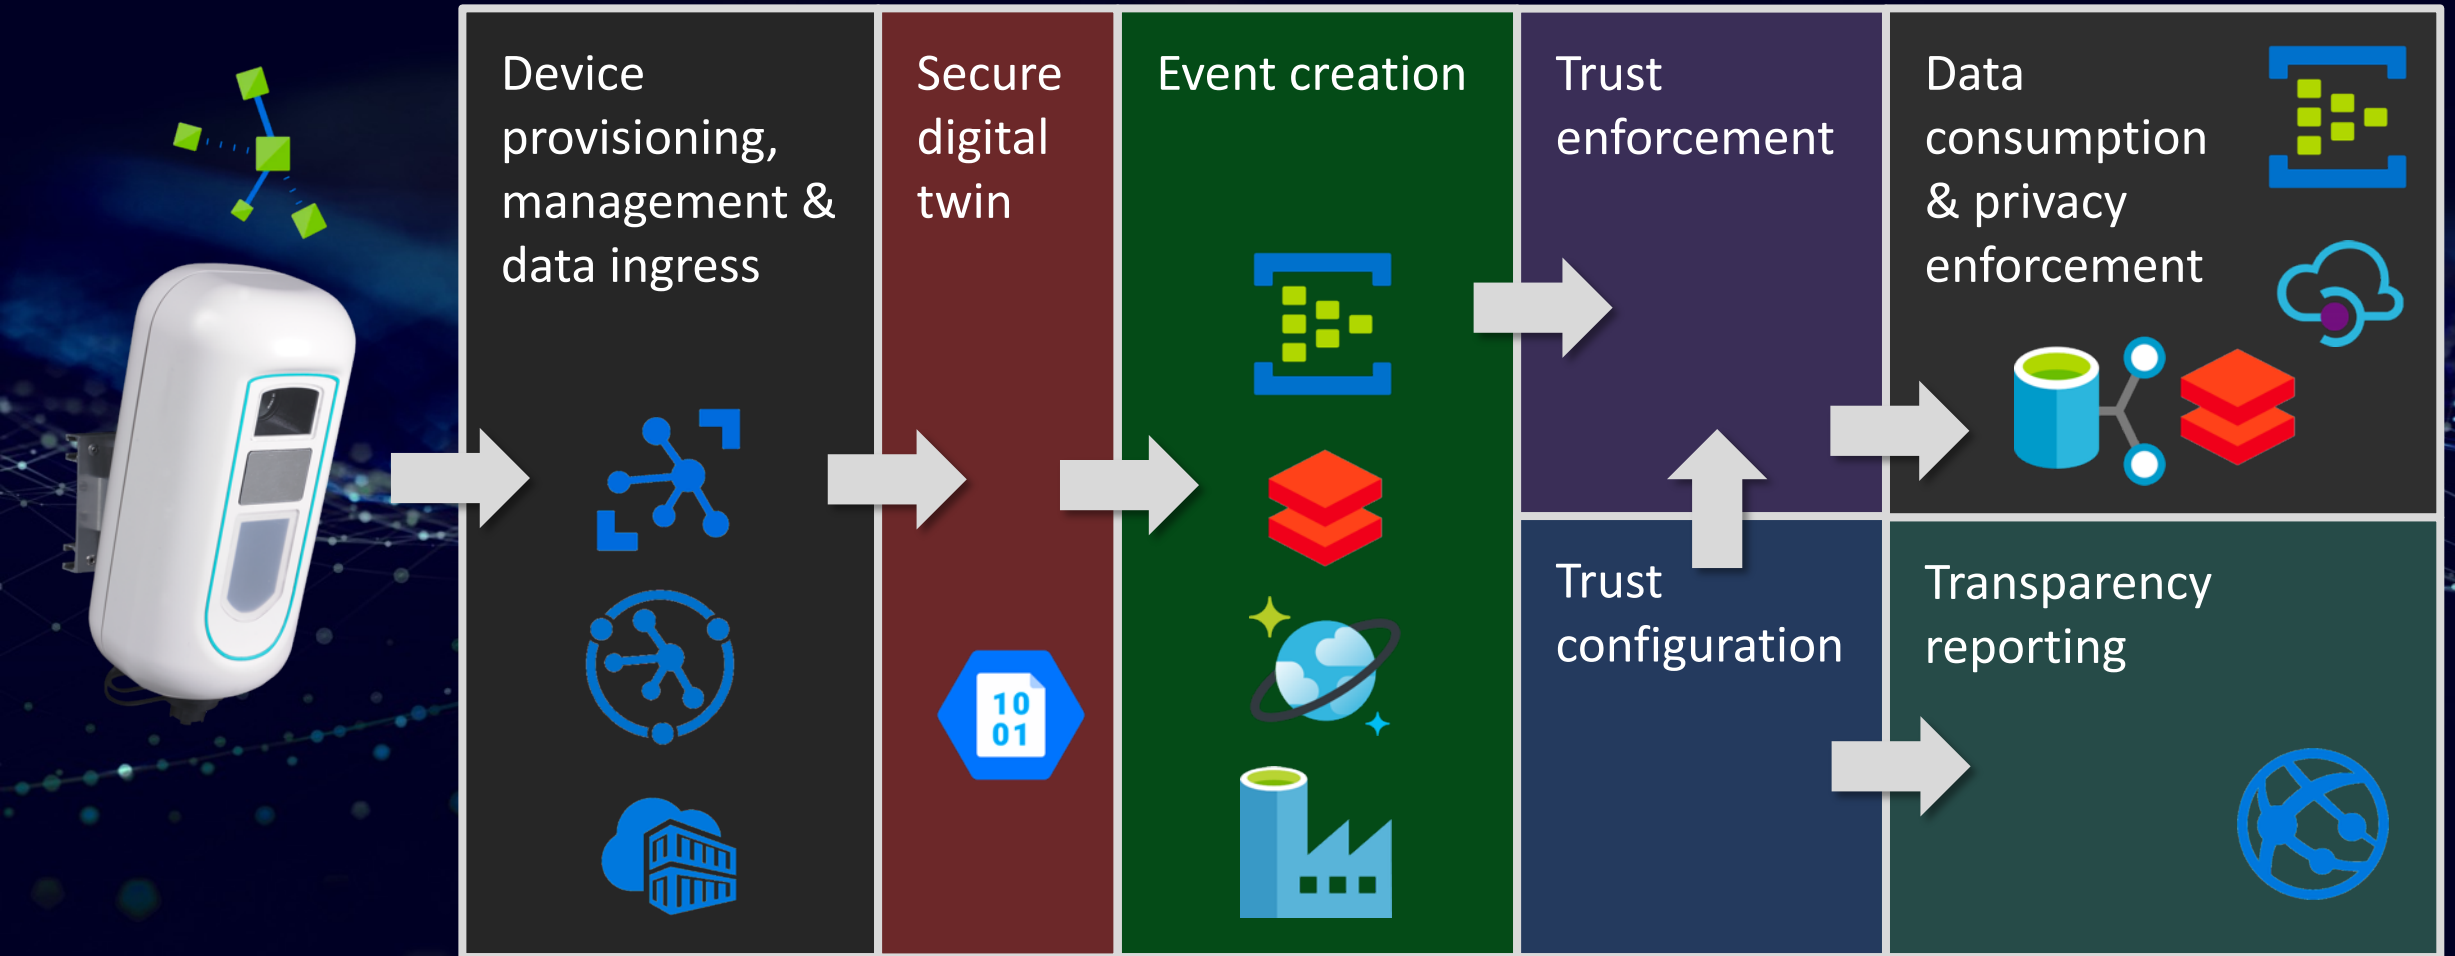

Urban data and development projects

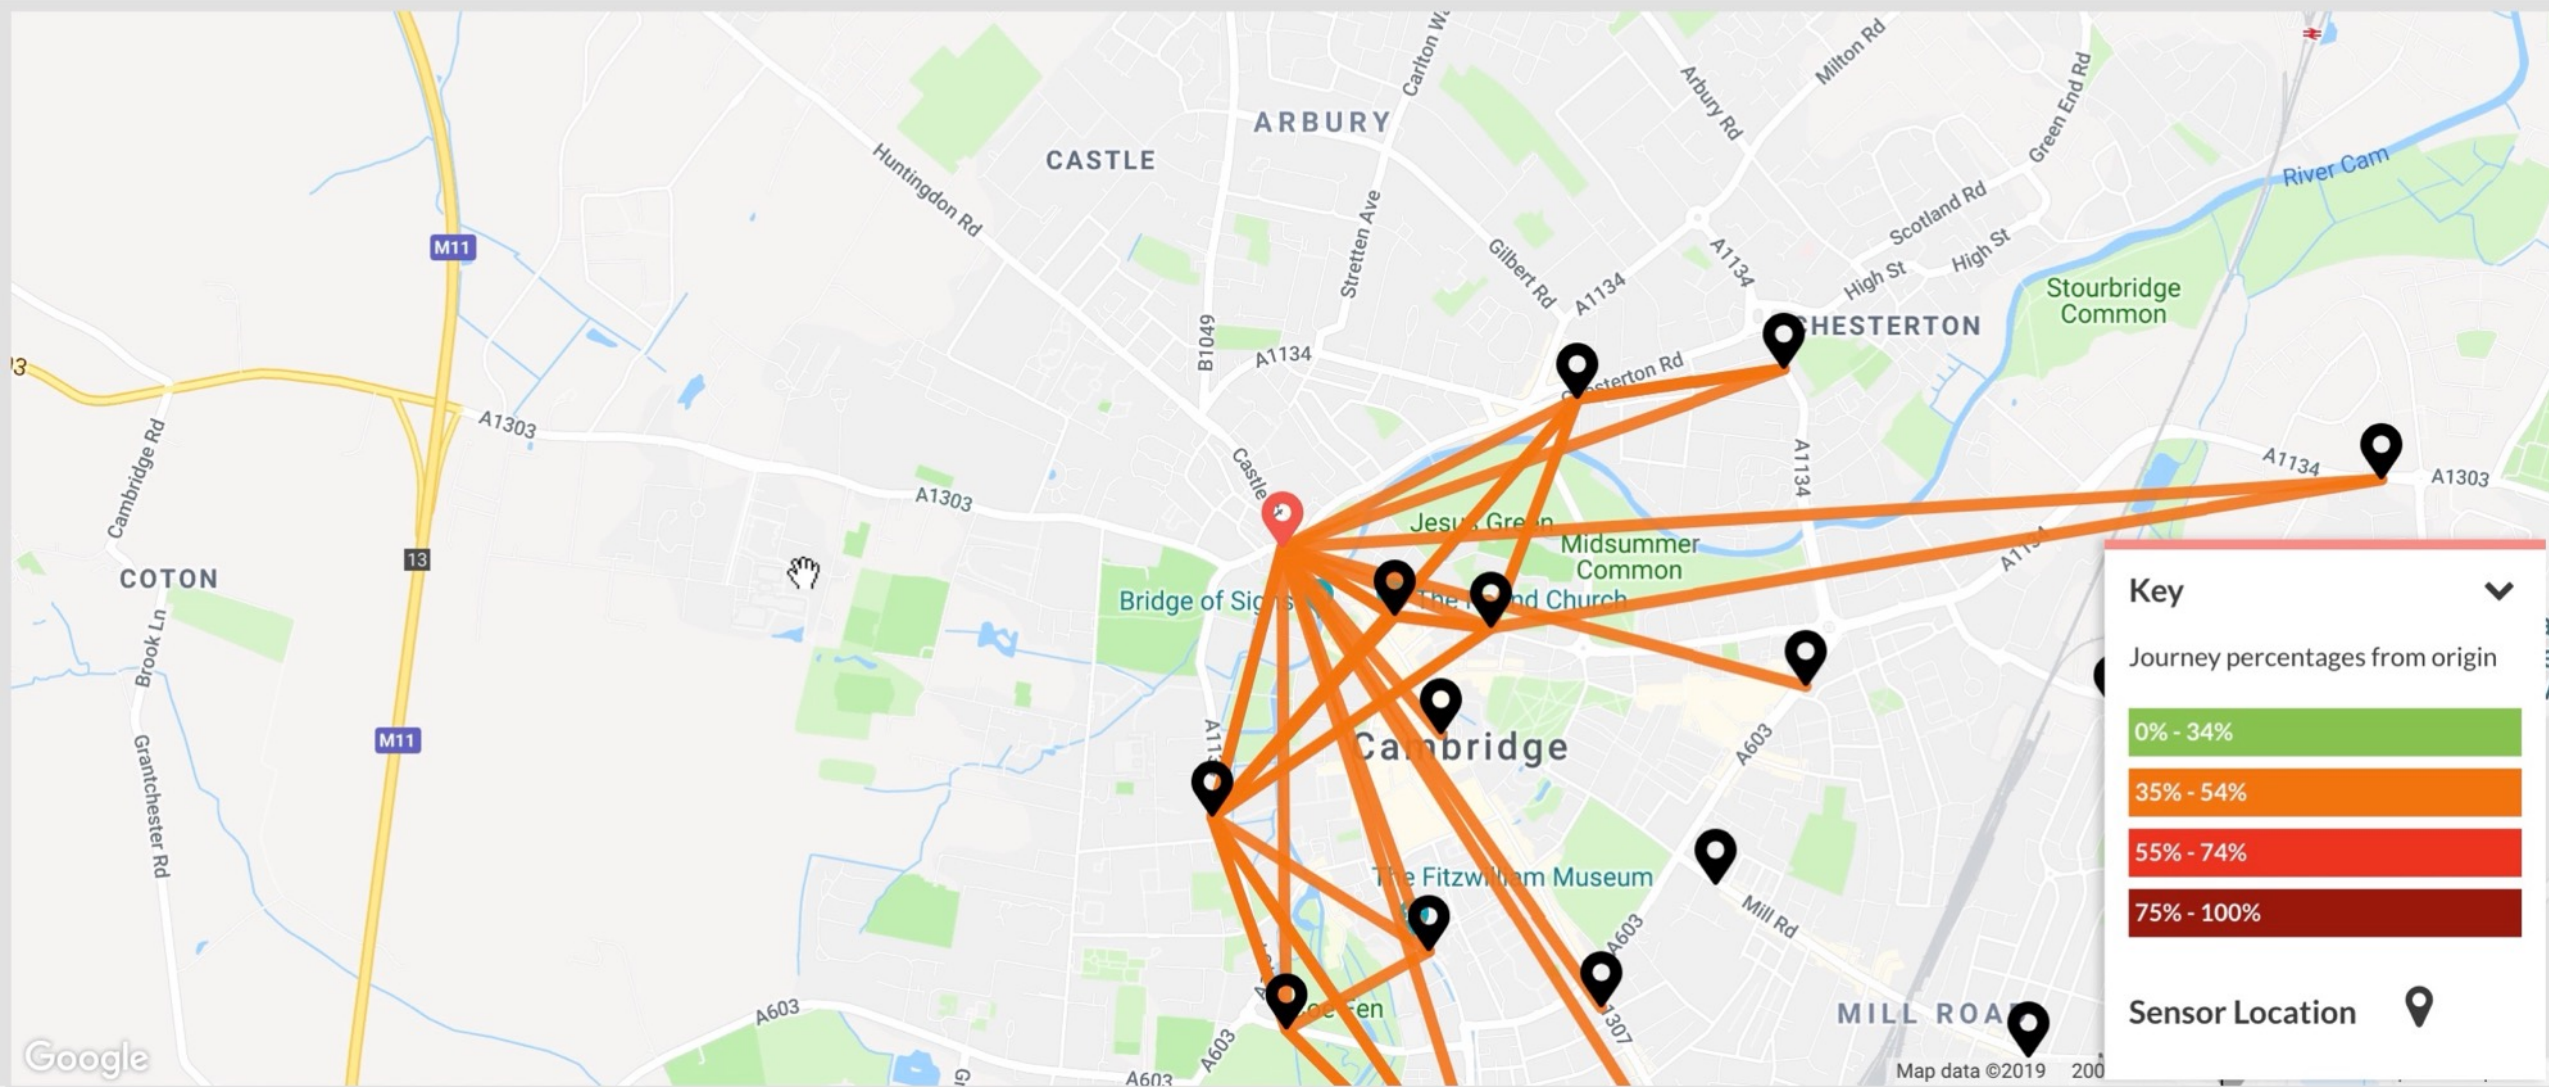

- Municipalities want to make good planning decisions and measure impact over the long term
- Developers want to demonstrate compliance in real-time and to eliminate phase delays
- Edge AI enables new data applications to be developed after the sensing infrastructure is deployed...

Extensible Azure platform

Welcome to RouteMind

Why citizen trust in urban data is essential

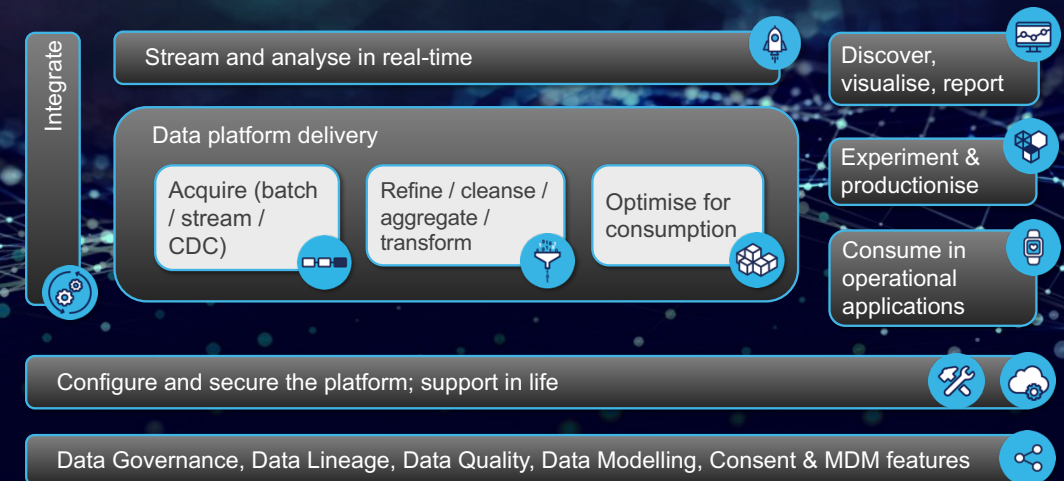

- Even meta city data is citizen data
- Public data collection is associated with big brother surveillance
- Citizens want to know what is being collected, who has access and what it is being used for
- They don't want city leaders to give away data value to Silicon Valley
- Reclaim data as a force for good
- Make data policy part of the democratic process

Bring your IOT solutions to life and to market.
